EXAMINER'S AMENDMENT

1. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it **MUST** be submitted no later than the payment of the issue fee.

The application has been amended as follows:

In the specification:

Page 9, line 3 in [0042], "nozzle plate surface 26" has been changed to "nozzle plate surface 24" because "26" stands for ink residuals and debris; and line 11, "arrangement 30" has been changed to "arrangement 28" because "30" stands for sidewall.

Page 11, lines 2 and 6, "nozzle plate 26" has been changed to "nozzle plate 24.

In the claim:

Claim 4:

"**the** length of said air exit slit" has been changed to "**a** length of said air exit slit" to correct a minor lack of antecedent basis problem.

2. Claims 1-10 are allowed.

3. The following is an examiner's statement of reasons for allowance:

The primary reason for the allowance of claim is the inclusion of the method step of cleaning said jet print head nozzle plate surface by scanning said open surface with said pressurized air stream. It is this step found in each of the claims, as they are claimed in the combination that has not been found, taught or suggested by the prior art of record, which makes these claims allowable over the prior art.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Conclusion

4. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

US 4,591,873, "Ink jet printing apparatus with orifice array cleaning system" issued to McCann et al., 5/86 teaches in their fig. 2, a storage and start-up station (9) similar to the "bath-tub like arrangement (28) of the instant application. The station (9) has a housing (30). The right-hand side of the housing can be seen as a sidewall of the housing having an air supply passage (31, and can be considered as corresponding to the exit slit 32 in the instant application). When cleaning of the orifice plate (25) of the print head (5) is required, the print head (5) moves to the place over the station (9) by drive (7). Then station (9) is raised to the dotted position as shown in fig. 2, with its two

seals (36 and 37) to seal the interface regions of the conduit 31 and sump 32 with print head assembly from the surrounding atmosphere. Then, the air is routed to a region which is below the orifice plate exterior surface to clean the orifice plate. However, McCann et al. fail to teach the scanning step, in which, the orifice plate is scanned by the air flow supplied by air source (17), since McCann et al.'s station (9) remains stationary during air is supplied to the print head to clean the orifice plate.
